CAREER OBJECTIVE

Highly motivated AI Engineering student with a solid foundation in Computer Vision and Machine Learning. Eager to expand my technical boundaries into Generative AI and Vision-Language Models (VLMs). Seeking a dynamic environment to learn rapidly from industry experts, contribute to real-world multimodal pipelines, and grow into a well-rounded AI Engineer.

EDUCATION

HCMC University of Technology and Engineering - HCMUTE

- B.E. in Information Technology, Specialization in Artificial Intelligence
- GPA: **3.5/4.0**
- Expected Graduation: August, 2027

PROJECTS

Skin-Lesion Classification on HAM10000

- Engineered and integrated ~30 handcrafted visual features with clinical patient metadata to construct comprehensive training matrices.
- Trained and fine-tuned LightGBM classifiers via randomized search, achieving an Accuracy of 0.807 and an OvR ROC-AUC of 0.946 on severely imbalanced data.

Scientific Research about High-Resolution Retinal Vessel Segmentation

- Developed an hybrid model for retinal blood vessel segmentation using a UNet++ with EfficientNet-B4. The model focuses on detecting micro-vessels that are often missed by traditional methods.
- Applied advanced data augmentation and validated performance using Dice, IoU, Sensitivity, and Accuracy metrics, achieving strong results on HRF dataset (Accuracy 0.964, Dice 0.771).

EmoViS: Fine-Grained Vietnamese Emotion Recognition

- Co-developed a dual-branch model combining ViSoBERT with 300-dimensional Emoji2Vec embeddings for 28-label emotion recognition on 20,664 Vietnamese social media comments.
- Evaluated 15+ configurations and achieved 0.6329 Macro-F1 using a three-seed ensemble-

TECHNICAL SKILLS

- Programming Languages: Python.
- ML/DL Frameworks: PyTorch.
- Databases: MySQL, ChromaDB.
- Data & Computer Vision: Pandas, NumPy, OpenCV, Matplotlib, Seaborn.

SKILLS

- Teamwork
- Time Management
- Critical Thinking
- Self-learning
- Research paper reading
